                                                                                                                                                                                                                                                                   The present invention describes a virus-like particle or gene delivery controls (I) provided with a ligand capable of binding to a human amino calls transporter. (I) is used to deliver genes to human cells or primate cells that express the hCAT1 amino acid transporter, such as endothalial, haematopoietic or smooth muscle cells, as part of a gene therapy regime. CC The vectors are especially useful for providing local applications of cadenoviral vector to patients with restenosis following balloon cC angioplasty, where smooth muscle cells need to be transduced with ceNOS CC cDNA, for example. (I) may also be used to pseudotype recombinant type C constitution (I) may be used in functional genomics where transduction of as many cell types as possible is required. The new gene delivery vehicles transduce DNA more efficiently and specifically into tissues that are compared to a wildtype adenoviral vector. This increased specificity results in lower multiplicities of infection which can occur with prior callow DNA to be transduced into cells that are in low abundance in cell mixtures and tissues, which increases their efficiency for use as gene concreases the potential host cell range of these vehicles. The present correspent inventions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel antibodies that immunospecifically bind to Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TWF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 1014-1015; 3148pp; English

The method is useful for the target delivery of substances to cells e.g. gene therapy. A human cationic amino acid transporter (hCATI) targeted adenovirus is useful for local applications of adenoviral vector e.g. in patients with restenosis following balloon angioplasty where smooth muscle cells need to be transduced with an adenoviral vector carrying the CeNOS cDNA. More efficient transduction of tissues can be carried out therefore resulting in lower multiplicity's of infections that can be used and therefore less vector associated toxicity to the tissues surrounding the target cells. AAZ38737 to AAZ38770, and AAY56264 to AAY56287 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gene delivery; virus-like particle; retroviral envelope molecule;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC neurite outgrowth, regeneration, remyelination and neuroprotection in C central nervous system (CNS). (1) is capable of inducing remyelination, CC promoting cellular proliferation of glial cells, and promoting Ca2+CC signaling with oligodendrocytes. An humanised antibody to (1) can be CC selected from antibody sHIGMY2 (LYM 22), ebwHigM MsI19D10, ebw HigM CC CB2bG8, AKJR4, CB2iE12, CB2iE7 or MSI19E5. (1) is useful for stimulating CC remyelination of CNS axons, stimulating proliferation of glial cells in CC CNS axons, or treating demyelinating proliferation of glial cells in CC CNS. (1) is preferably useful for treating a demyelinating disease of CNS in a mammal in need CC for a mouse infected with Strain DA of Theiler's murine encephalomyelitis (TMEV) or for treating a human being having multiple sclerosis, or a cC neural disease of CNS. (1) is preferably useful for treating ademyelinating disease, or a post-neural disease of CNS. (1) is also useful for stimulating tremyelination of CNS axons. The CC (1) is also useful for stimulating remyelination of CNS axons. The cc antibodies are useful for preventing infection by a bacterium, virus or condition in a subject. Methods where (1) is administered to a patient CC already disease, amyotrophic lateral sclerosis (ALS), a virus or condition disease, anyotrophic lateral sclerosis (ALS), a virus or condition of disease, and other conditions in the CNS where nerves are damaged as by trauma. The present sequence represents cc the sHigM22 heavy chain variable region clone A amino acid sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to dispose disease associated with aberrant BLyS expression and activity such as cancer, immune, and activity may also be

The hererominibodies have cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and treating malignant cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is the left chain of a heterominibody comprising HD70 single-chain Fv (scFv) fragment N-terminally linked human CH1 domain which bears at its C-terminus the human inflammaton cytokine granulocyte/macrophage colony stimulating factor (GM-CSF), a hexahistidine sequence for ease of purification. HD70 scFv specifically recognises the human epithelial cell adhesion molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             EpCAM; epithelial cell adhesion molecule; inflammatory cytokine; IL-2; interleukin-2; Ck-domain; kappa light chain constant domain; heterominibody; multifunctional compound; immunoglobulin; cytostatic; immunostimulatory; antileukaemia; diagnosis; prevention; antiproliferative; treatment; malignant; haematopoietic cell; lymphoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY44995 standard; Protein;

The polypeptide chains further comprise, fused to the constant domains at least two (poly) peptides having different receptor or ligand functions, where further at least two of the different (poly) peptides lack an intrinsic affinity for one another and are linked via the constant domains. The heterominbodies have cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and activities. These compounds can be used for diagnosing, preventing and activities. These compounds can be used for diagnosing, preventing and creating malignant cell growth related to malignancies of haematopoistic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is the right chain of a heterominibody comprising HD70 single-chain Fv (scFv) fragment N-terminally linked to the comprising the constant domain of immunoglobulin-kappa light chain) which bears at its C-terminus the human inflammatory cytokine interleukin-2 (IL-2). HD70 scFv specifically recognises the human epithelial cell adhesion molecule (EpCAM) also called 17-1A antigen.

The method is useful to identify bior multivalent polypeptides that comprise antibody binding sites capable of efficiently bindings to the corresponding antigen. The polypeptides or antibodies identified by the method are useful therapeutically and diagnostically, for e.g. cancer and autoimmune diseases. ScPv-antibody fragments that bind independently of their position within bifunctional single-chain fusion proteins can be isolated from combinatorial antibody libraries using the new in vitro method.
This is the amino acid sequence of the human D4.5 heavy chain variable region, used in the method of the invention. for providing receptors that can be used for targeting antigens in humans without being immunogenic themselves. Such receptors can be used for treating

The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodimer of two polypeptide chains, where one of the polypeptide chains comprises, a CHI-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CI-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, fused to the constant domains at least two (poly)peptides having different receptor or ligand functions, where further at least two of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HD70; single-chain variable fragment; scFv; 17-1A antigen; human; EpCAM; epithelial cell adhesion molecule; inflammatory cytokine; GM-CSF; granulocyte/macrophage colony stimulating factor; heterominibody; CH1-domain; multifunctional compound; heavy chain constant domain; immunoglobulin; cytostatic; immunostimulatory; antileukaemia; diagnosis; antiproliferative; prevention; treatment; malignant; haematopoietic cell;

                                                                                                                                                                                 gene (AAT60369) obtained by panning a phage antibody library produced from cloned germline V genes and synthetic CDRs. The antigen-
and/or beta-2 can be used to counter the adverse effects of TGF beta-1 and/or beta-2 can be used to counter the adverse effects of TGF beta, such as (i) promotion of fibrosis (in dermal, ocular or keloid scarring, lung fibrosis, arterial injury, proliferative retinopathy, retinal detachment, adult respiratory distress syndrome, liver cirrhosis, post myocardial infarction, post-
c angioplasty restanosis, scleroderma, vascular disorders, cataract, also (not claimed) osteoporosis), or (ii) immune and inflammatory diseases (e.g. rheumatoid arthritis, macrophage deficiency diseases (or macrophage pathogen infection). Nucleic acids encoding human antibody VH and VL can be used for prodn. of recombinant antigenbinding domains. These are highly specific, have low dissociation.

XX H The invention relates to a method of identifying binding site domains (BSD) that retain the capacity of binding to a predetermined epitope when positioned C-terminal of at least one further domain in a recombinant bior multivalent polypeptide. The method comprises (a) testing a panel of BSD displayed on the surface of a biological display system as part of a fusion protein for binding to a predetermined epitope, where the fusion

This polypeptide sequence comprises the VH domain of human antibody 2A-H11 (also known as 6H1), which is specific for transforming growth factor (TGF) beta-2. It is encoded by

8CFV

Examphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the Ct tumour necrosis factor (TNF) super family and induces B cell tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have Ctycostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity of BLyS. The antibodies bind to BLyS cinhibit the expression and activity of BLyS. The antibodies bind to BLyS cand so may be used to detect and quantitate the presence of BLyS in CC and so may be used may be used in this way to diagnose disease CC associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression cC and activity such as cancer, immune, and autoimmune disorders and cdiseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, cc immunodeficiency (e.g. common variable immunodeficiency (CVID) and cc difficulties and fragments of the antibodies described in the method contributions and fragments of the antibodies described in the method contributions.
                                                                                                                                                                                                                                                                                     Query Match

The invention provides a neuromodulatory agent (I) capable of promoting coentral nervous system (CNS). (I) is capable of inducing remyelination, coentral nervous system (CNS). (I) is capable of inducing remyelination, coentral nervous system (CNS). (I) is capable of inducing remyelination, coentral nervous system (CNS). (I) is capable of inducing remyelination, coentral remyelination of glial cells, and promoting Ca2+ coentral nervous system (CNS). (I) is useful for mannised antibody to (I) can be coentral coentral remyelination of CNS axons, or treating demyelinating proliferation of glial cells in coentral coentral remyel. (I) is capable of binding to structures and cells within coentral coentral remyelinating disease of CNS (I) is preferably useful for treating a demyelinating disease of CNS (I) is preferably useful for treating a demyelinating disease of CNS (TMEV) or for treating a human being having multiple sclerosis, or a post-neural disease of CNS. (I) is also useful for stimulating the proliferation of glial cells from mixed cell culture. (I) is also useful for stimulating remyelination of CNS axons. The condition in a subject. Methods where (I) is administered to a patient causes demyelination or other neurodegenerative condition in a subject. Methods where (I) is administered to a patient causeful for treating multiple sclerosis, Parkinson's disease, and other conditions in the CNS where nerves are damaged as by trauma. The present sequence represents the shights the shights have close a sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ð

(I) is useful a primer or probe i presence of inhibitory antibodies directed against fac polypeptides of the invention and the antibodies generate useful in compositions for neutralizing factor VII antibodies in hemophilia A patients. This sequence refactor VIII antibody A3-C1 specific scFv protein B35 win the method of the invention.
hybridizable polynucleotide (I) (; hybridizable polynucleotides) comprising a contiguous coding for a human antibody with factor VIII specific; hemostatic activity. (I) is useful a primer or probe presence of inhibitory antibodies directed against far polypeptides of the invention and the antibodies gene) are useful in compositions for neutralizing factor VII antibodies in hemophilia A patients. This sequence repared to the invention of the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the antibodies generated the properties of the invention and the properties of the invention and the antibodies generated the properties of the invention and the properties of the invention and the antibodies generated the properties of the invention and the invention and the properties of the invention and the properties of the invention and the invention
                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide, polypeptide and antibody useful for presence of neutralizing antibodies against factor VIT treatment of hemophilia A patients with these antibod

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                            This invention describes novel recombinant anti-human TNF-alpha monoclonal antibody consisting of a heavy (H) chain and a light chain. The recombinant anti-human TNF-alpha human monoclonal antican be produced stably in a high purity and in a large amount.
                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 3; Page 12-13; 22pp; Japanese.

Proc. Natl. Acad. Sci. U.S.A. 75:966-969(1978).
-i- MISCELLANEOUS: THE SEQUENCE OF THE ALPHA-2, A2M(2)
REGION OF THIS MYELOMA PROTEIN IS ALSO GIVEN.
-i- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eut
